Research problem: How do students describe the relationship between social media use and study routines?

Introduction

This illustrative draft explores how students describe social media use in relation to their daily study routines. It is sample content for a UI walkthrough, not a completed research study.

The proposed study distinguishes between using online platforms for academic collaboration and using them for leisure. A student might discuss an assignment with classmates, watch a tutorial, or switch between schoolwork and personal messages. These activities should be examined separately rather than treated as one behavior.

The research question focuses on students' experiences: when do they use these platforms, what purposes do they report, and how do they organize their study time? Interviews and a short study diary are possible methods to explore these questions.

A review of related literature would compare definitions, methods, findings, and limitations across verified sources. References and claims should be added only after the original papers have been checked. No published findings or citations are asserted in this example.

The next step is to define the scope of the study, identify suitable participants, and prepare a transparent plan for gathering and analyzing the evidence.
